Excel RTD example in CSharp

I have created a [C# implementation](#) of the code from the MSDN article "[Building Excel Real-Time Data Components in Visual Basic .NET](#)".

You still need to read the article to understand the IRtdServer interface (as far as I know, that article comprises the only documentation I've seen for IRtdServer). The emphasis of my implementation is on minimal changes to the way the VB.NET version works, however some things quite different, e.g. there is no Collection class in C# so I use a Hashtable - and that makes some changes to iterators, accessors, etc. It's all for the better since *Visual Basic sucks*.

You can download the [C# code here](#). In the future I may post a version where the quote-generator runs in (a) separate thread(s).

I have created a VB.NET DLL which implements
IRTDServer interface. I hav also created Windows
installer for installing this dll. As per our company
rule, only user with admin right can install a
software. so when i install this with admin user,
the component is not accessible to normal user
when i open Excel sheet. And when i give admin
rights to normal user, the component is accessble.
I wanted to know that is there any special access
to any service or component is needed to access
this IRTDserver component which only admin user
can have ?
